Tattoo consent form

During an MRI scan, certain types of tattoos may heat up if they are inside the region being scanned; in exceptional conditions some burning may occur around the tattoo (in extreme cases leading to blistering). For people with facial or genital tattoos or large tattoos (greater than 7.5 cm across), such burning could be particularly inconvenient or uncomfortable and may require medical care.

People may feel tingling at the site of the tattoo during scanning if it is going to heat up, and this provides a warning of a potential problem.

On the safety screening form you have filled out you have indicated that you have a tattoo. Therefore we are asking you to sign a form to confirm we have explained what might happen, and that you will tell us if you feel anything unusual on the tattoo during scanning.

What happens if I feel any heating or tingling in my tattoo?

Alert the scanner operator using the call bell. We will stop the scan immediately. If there are any signs of heating we will apply a cold compress. In extreme situations we will seek medical help.

Statement of consent

I confirm that the researcher has explained the risk of having a scan with a tattoo and I want to proceed with the scan. I will alert the operator if I feel any heating or tingling in my tattoo(s).

I understand that if this happens then the MR scan will NOT be performed.
